

Kopron Industrial Tent Storage Buildings

Fundamental benefits of our building:-

- Designed to bolt together on site by means of structural steel fixings assembling into a framework clad in reinforced flame retardant PVC.
- It is fully retractable to save precious space.
- It is totally relocatable with no component damage.
- The construction method allows you to fix most building materials easily to the super structure without any additional masonry or supporting steel.
- It comes with its own ring beam construction to raft the building so it can be used on any surface with ease including water.
- A full menu of accessories is available.
- As the structure is of independent design (as opposed to an inter-dependent design with portal frames) it is freestanding. This makes a vast difference to the requirement for civil engineering foundations which are minimal with our design.
- Since we manufacture our own doors, a full range and choice is available.
- The structure is ideal for letting or semi-permanent sites
- The buildings can be equipped with fire wall barriers which would entirely protect the building content.
- It has the lowest cost of ownership and the longest life of any building on the market. The skin is very durable and in the event of damage it is very inexpensive and easy to repair.
- It does not depend upon any other complicated cold rolled metal structures.
- It does not require expensive professional fees at the design phase
- We provide all the professional support you need for design, build, fit out and equipping
- It can be freely modified within its life time to respond to upgraded needs with minimal cost and disruption.

Special Architectural Notes

If you are an architect or specifier then you will find as part of an existing project this is a very easy, well supported add on to your project with special incentives, design support and technical back up for the simplest project inclusion and greatest ease of installation. Service loadings and mezzanine floor facilities are no problem. It can be used as an aircraft hangar, a floating boatyard assembly shop or warehouse and specialist engineering support is available at no extra cost for fitting out with storage and lifting equipment or for workshop extensions.
